Common Issues in OOP

Charlotte Pierce

We call methods a lot in objectoriented programming

Parameters define the **expectations** of a method

public static void DrawCircle(Color clr, double x, double y, double radius)

I would like a colour and three doubles please!

When we call a method we need to **fulfil** those expectations

```
SplashKit.DrawCircle(Color.Black, X, Y, 10);

Please draw a circle for me, here is a colour and
```

public static void DrawCircle(Color clr, double x, double y, double radius)

three doubles

Ok got it!

When we call a method we need to **fulfil** those expectations

Please draw a circle for me, here is a colour, a boolean, and two doubles

SplashKit.DrawCircle(Color.Black, true, Y, Radius + 1);

readonly struct System.Boolean

Represents a Boolean (true or false) value.

Argument 2: cannot convert from 'bool' to 'double'

Show potential fixes

public static void DrawCircle(Color clr, double x, double y, double radius)

I have no idea how to do that...

The method already knows what kind of data it is expecting

```
SplashKit.DrawCircle(Color.Black, X, Y, 10);
```

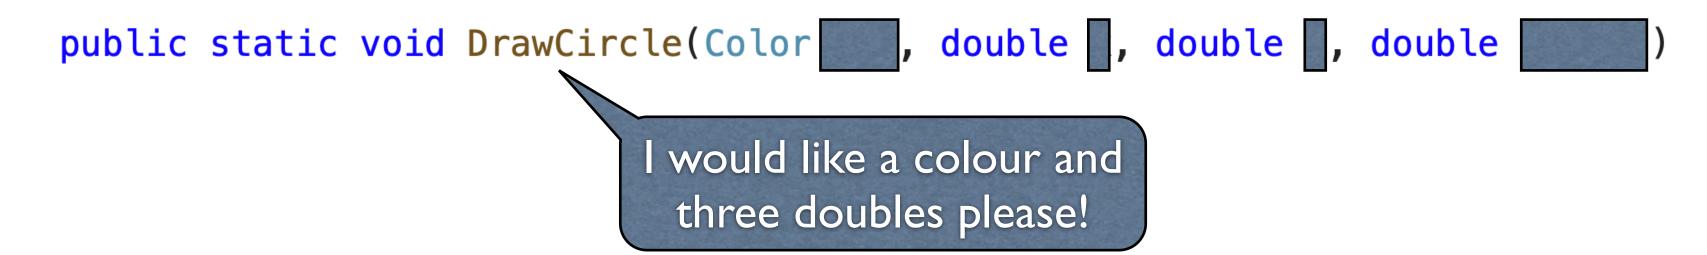

```
SplashKit.DrawCircle(Color Color.Black, double X, double Y, double 10);
```

The method already knows what kind of data it is expecting

```
SplashKit.DrawCircle(Color.Black, X, Y, 10);
```

```
SplashKit.DrawCircle(Color Color ck, double X, double Y, double 10);
```

The names of the parameters don't matter!

We can **overload** methods with different expectations

Methods can have the same name as long as they have different parameters

```
public static void DrawRectangle(Color clr, Rectangle rect)...
public static void DrawRectangle(Color clr, Rectangle rect, DrawingOptions opts)...
public static void DrawRectangle(Color clr, double x, double y, double width, double height)...
public static void DrawRectangle(Color clr, double x, double y, double width, double height, DrawingOptions opts)
```

```
^ 1 of 4 ∨ void SplashKit.DrawRectangle(Color clr, Rectangle rect)
SplashKit.DrawRectangle()
```

Often overloaded methods will call each other

```
public Shape(Color shapeColor)
{
    ShapeColor = shapeColor;
    X = 0;
    Y = 0;
    Selected = false;
}

public Shape() : this(Color.Yellow) { }
```

Only overload when you need to

It's important to understand the **scope** of a variable

I know about a variable called 'i'!

```
public void MethodOne()
{
    int i;
    for (i = 0; i < 10; i++)
    {
        // do something
    }
}</pre>
```

I know about a variable called 'i'!

I know about a different 'i'! Neat!

```
public void MethodOne()
{
   int i;

   for (i = 0; i < 10; i++)
   {
      // do something
   }
}</pre>
```

```
public void MethodTwo()
{
   int i;

   for (i = 0; i < 10; i++)
   {
      // do something
   }
}</pre>
```

```
public void MethodOne()
    int i;
    for (i = 0; i < 10; i++)
     // do something
    int i;
```

```
public void MethodOne()
    int i;
    for (i = 0; i < 10; i++)
        // do something
    int i;
```

Already exists!

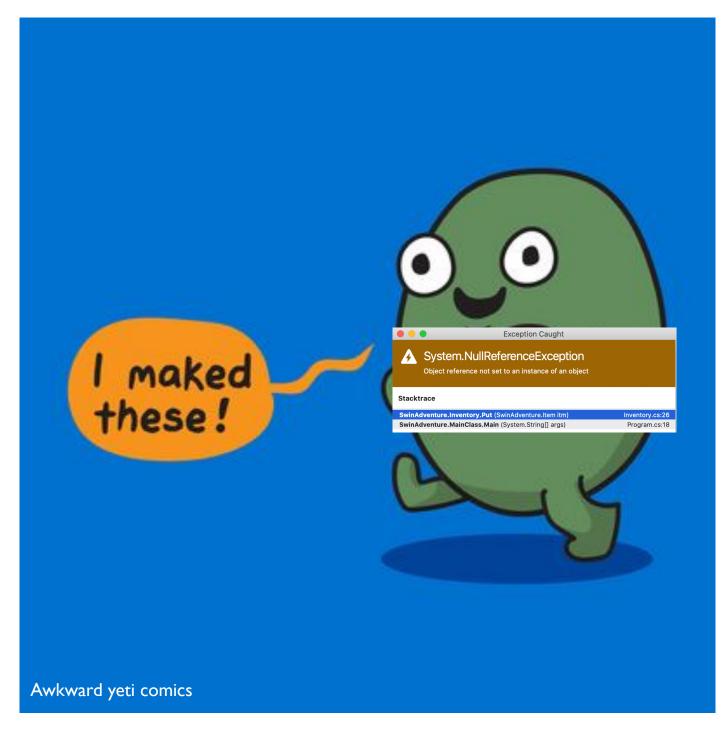

```
public void MethodOne(int X)
{
    // do something
}

public void MethodTwo(int X)
{
    // do something
}
```

Scope can be for a method, a class, or a namespace

Let's talk about error messages...

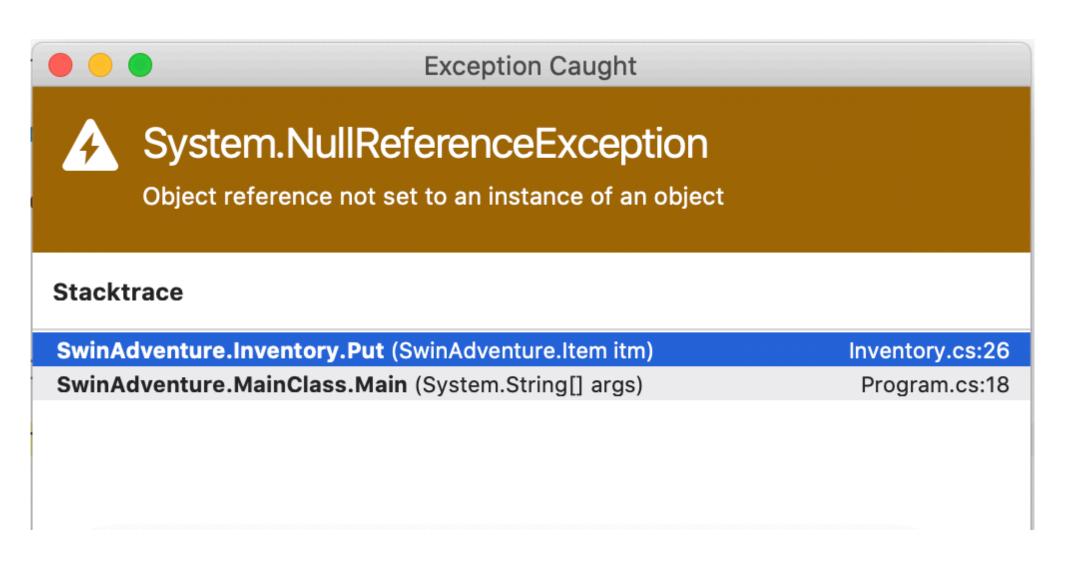

The computer is *trying* to help you...

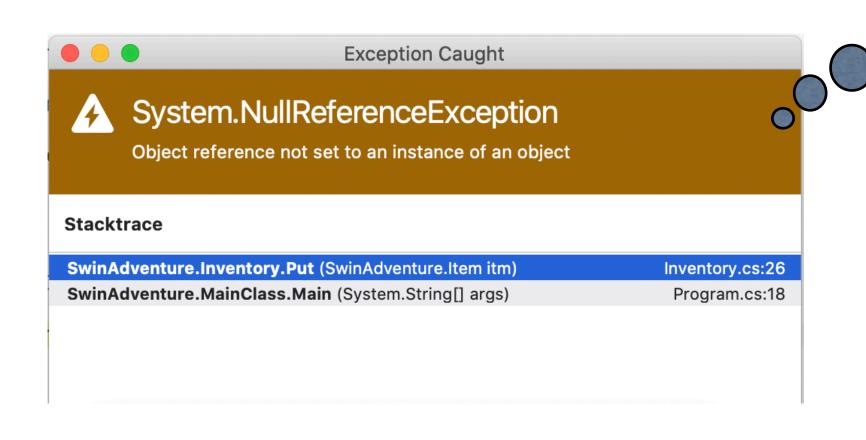

...but we need to learn how to listen

The computer will tell you where it **thinks** the error is happening

...but it's not always right

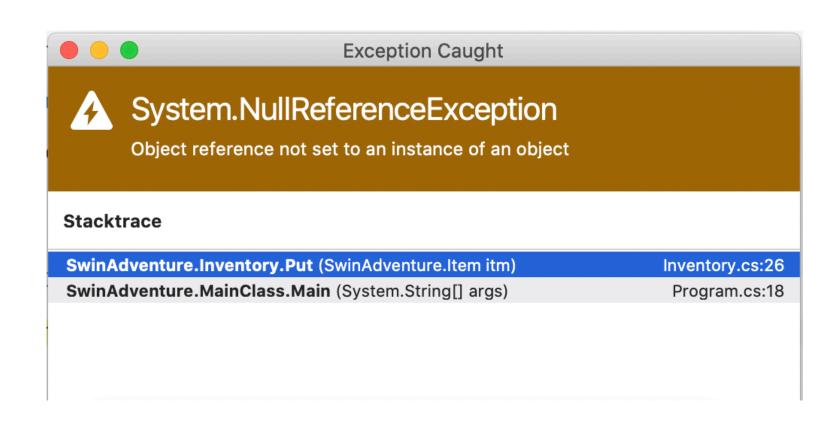

I think the problem is here...

```
public void Put(Item itm)

public void Put(Item itm)

{
    _items.Add(itm);
}
```

...but it's not always right

```
public class Inventory

public class Inventory

private List<Item>_items;

public Inventory()

full

public Inventory()

full

public Inventory()

full

public Inventory()

full

full

public Inventory()
```

It takes practice!

(and some debugging)

Documentation is your friend

Every good API will have documentation

Functions Draw Circle

Overloaded

```
This function is overloaded. The following versions exist.

Draw Circle ( clr: Color c: Circle )

Draw Circle ( clr: Color c: Circle opts: Drawing Options )

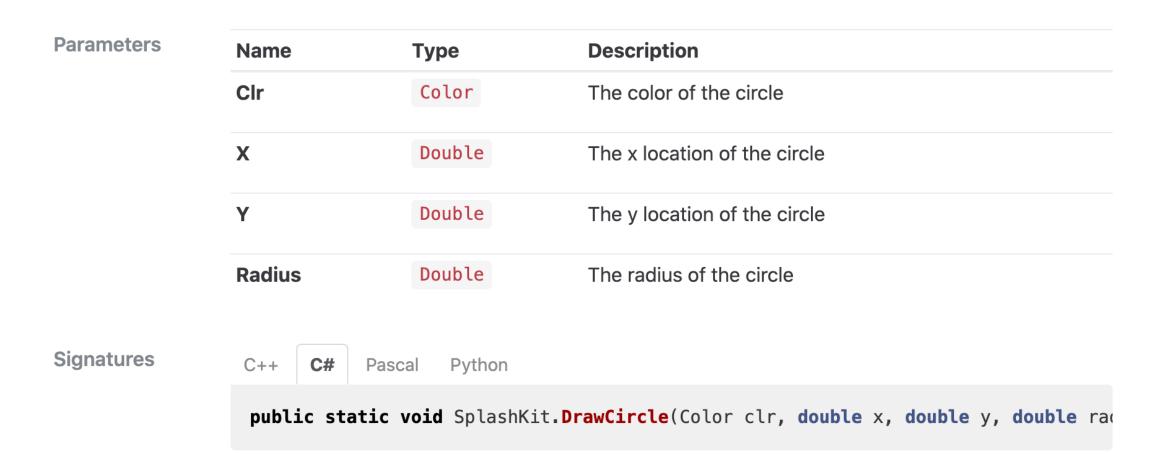

Draw Circle ( clr: Color x: Double y: Double radius: Double )

Draw Circle ( clr: Color x: Double y: Double radius: Double opts: Drawing Options )
```

Every good API will have documentation

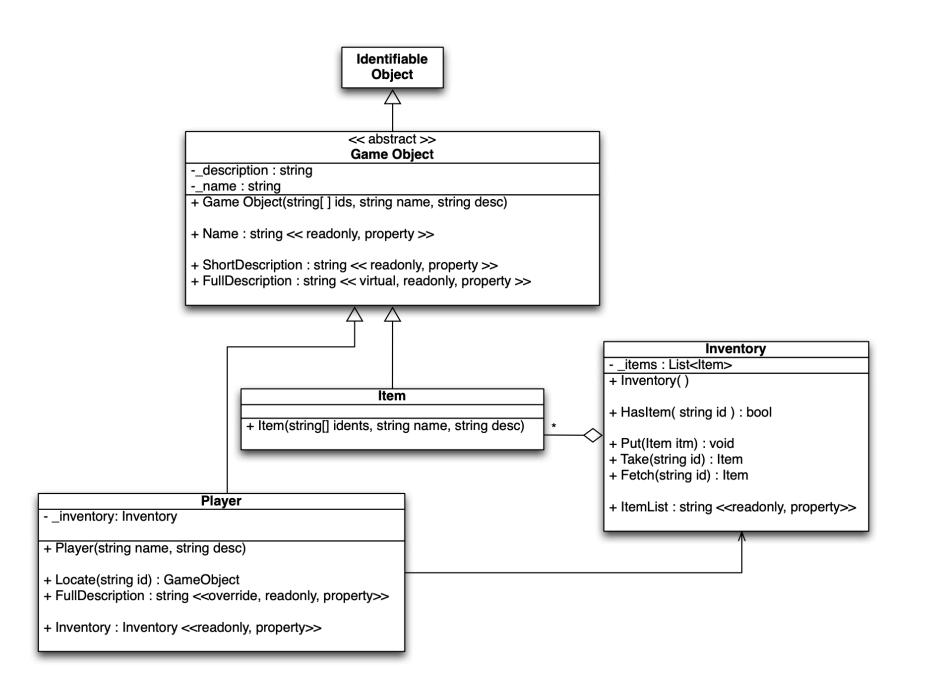

Draw Circle

Draw a circle onto the current window. The circle is centred on its x, y coordinates, and has the provided radius.

Explore API documentation to find out what you can do!

When we give you a design, we have our reasons...

One last thing...

Google!

"Any developer who doesn't have a full tab bar of Google and Stack Overflow tabs isn't working"

"I google basic stuff all the time Like, "****, what does String.format do again?" *googles "java string" and goes to the java docs*"

Google!

"There are millions of developers out there, and it's very likely at least one of them has come across your problem before. Googling your issue will give you links to those discussions and solutions."
